### **Abstracts**

This article aims to determine the effect of inflation, the BI Rate, the exchange rate of the rupiah to the US dollar, and the amount of money supply for Third Party Funds (TPF) in Indonesians' Islamic Banks during 2013-2016. This research method uses multiple regression analysis with time series data; gathering data from 48 samples of which are monthly data on the variables. The result of this research find that the inflation and exchange rate variables have no significant effect on TPF, while the BI Rate variable and the money supply have a significant effect on TPF. In doing so, Islamic banking can pay serious attention to the BI rate and the money supply and in this study the BI rate on the direction of TPF.

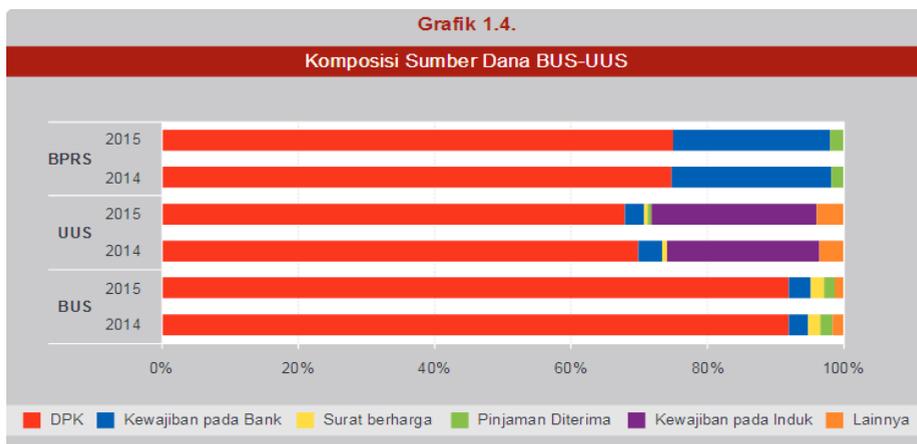

**Keywords:** inflation, BI rate, exchange rate, Third Party Funds

### **Introduction**

The growth of financial institutions, especially Islamic commercial banks, experienced a significant increase in the last few decades. Based on the 2015 Islamic Financial Development report, the asset growth of Islamic Commercial Banks amounted to ± Rp 304 trillion, up 9% from the previous year, with a total TPF of ± Rp 236 trillion, up 6.37% from the previous year (www.ojk.go.id). On average, most of the bank's total

assets, including Islamic Commercial Banks, are from the community called Third Party Funds (TPF), as the following 2015 Islamic banking data:

**Figure 1. Fund Composition of BUS-UUS**

Source: 2015 Islamic Banking and Financial Progress Report

The growth of Islamic Commercial Bank Deposits is salient; the third party funds of Islamic Commercial Banks constitute the majority of funds that will be channeled to financing customers that affect the profit of Islamic Commercial Banks. Sources of funds for Islamic Commercial Banks (not including capital) are generally dominated by third parties, reaching 84.5% of the total funding sources. The amount of third party funds reflects public trust in the bank. The rise and fall of TPF is influenced by many factors, both internal factors originating from the bank itself and external factors derived from macroeconomic conditions (Mumtazah and Septiarini, 2016: 801). Macroeconomic factors referred to include inflation, interest rates (BI rate), the exchange rate of the rupiah against the US dollar, the amount of money circulating in the community.

**Figure 2. 2017 State Budget Assumptions**

Indikator	Realisasi APBN 2015	APBNP 2016	APBN 2017
Pertumbuhan Ekonomi (% y/y)	4.8	5.2	5.1
Inflasi (% y/y)	3.4	4.0	4.0
3-Mo Treasury (%)	6.0	5.5	5.3
Nilai Tukar (IDR / USD)	13.392	13.500	13.300
ICP (USD / barel)	50	40	45
Lifting minyak (Th barel / hari)	779	820	815
Lifting gas (Th barel / hari)	1.195	1.150	1.150

Sumber: Kemenkeu

According to the 2016 Indonesian Economic Outlook data, Indonesia's inflation growth will be maintained. According to Mumtazah and Septiarini (2016), high inflation causes a continuous increase in prices of goods and services (not just one type of goods and a moment) (Iswardono, n.d.). Low inflation causes the prices of goods and services to decline, causing people to have excess funds to be saved in savings or invested.

The second macroeconomic factor is the interest rate (BI Rate). The high interest of customers to save is influenced by the interest rate (BI Rate). Higher the interest rate, higher the public interest in saving by expecting interest from a larger conventional bank. In an Islamic Commercial Bank, when the BI Rate is high, Islamic Commercial Banks are not permitted to increase the percentage of profit sharing in financing, because it has been agreed upon at the beginning of the contract. In this condition the Islamic Commercial Bank is faced with the condition of the risk of not competing profit sharing with Third Party Funds (Sudarwanto, 2011). In the last two years, from 2015-2016, the BI Rate was 3.4% and 4.0% and was below

the benchmark interest rate set by BI which was 6.5%. Here the researcher wants to test whether the decreasing BI Rate can increase the interest of customers in saving their funds in Islamic Commercial Banks.

The third macroeconomic factor is the rupiah exchange rate (Rp) to the dollar (\$). Islamic banks in conducting fund collection policies are influenced by the rupiah exchange rate against the dollar. If the rupiah exchange rate against the dollar rises it will suppress demand (demand) and vice versa if the rupiah exchange rate against the dollar falls demand (demand) will increase. The fourth macroeconomic factor is the amount of money in circulation (JUB). The amount of money in circulation is the entire money circulating in the community which consists of currency and demand deposits (Iwardono, n.d.). The increase in the amount of money circulating resulted in an increase in the number of depositor funds (Maries, 2008). This article is intended to examine the influence of macro economic conditions on third party funds of Islamic Banking in Indonesia.

### **Underlying Theory**

Third Party Funds or Deposits are funds collected by banks that come from the community in a broad sense including the community, individuals and business entities (Ismail, 2011). Deposits are collected in the form of *wadiah* giro, *wadiah* savings, *mudharabah* savings and *mudharabah* deposits. Law No.21 of 2008 concerning Islamic banking article 1 states that deposits (Third Party Funds) are funds entrusted by customers to Islamic banks and / or UUS based on *wadiah* agreements or other contracts that do not conflict with Islamic principles in the form of demand deposits, savings or other forms equivalent to that (Pratiwi & Lukmana, 2015). From some of the descriptions above it can be concluded that Third Party Funds are funds collected by banks from the community in the form of savings, demand deposits, and deposits which are then used

by banks for operational activities, including the distribution of funds to the public (Muyunda, Mee, Todd, Musonda, & Michelo, 2018).

Inflation is briefly interpreted as a tendency to increase prices of goods and services in general and continuously (Suseno & Astiyah, 2009). There are three important things that must be emphasized from the definition of inflation, namely:

1. There is a tendency for prices to increase
2. The price increase takes place continuously

The price level in question is the general price level, or not just one commodity. The indicator that is often used to measure the inflation rate is the Consumer Price Index (CPI). Changes in CPI from time to time indicate the price movement of the package of goods and services consumed by the public. Since July 2008, the package of goods and services in the CPI basket has been carried out on the basis of the 2007 Cost of Living Survey conducted by the Central Statistics Agency (BPS).

The BI Rate is a policy interest rate that reflects the monetary policy stance or stance set by the Indonesian bank and announced to the public ([www.bi.go.id](http://www.bi.go.id)). Taking into account other factors in the economy, Bank Indonesia will generally raise the BI Rate if future inflation is expected to exceed the set target, whereas Bank Indonesia will reduce the BI Rate if future inflation is expected to be below the target set (Muttaqiena, 2013). According to the classical theory of savings is a function of interest rates where the movement of interest rates on the economy affects savings that occur (Srito, Khantanapha, & Piriyaikul, 2018). It means that people's desire to save depends very much on the interest rate. The higher the interest rate, the greater the desire of the people to save or the community will be motivated to sacrifice their expenses to increase the amount of savings so that the interest rate according to the classic is remuneration received (Alhifni, Huda, Anshori, & Trihantana, 2017). Some argue that

the increase in conventional interest rates led to an increase in the risk of displacement funds (transfer of funds from Islamic banks to conventional banks) faced by Islamic banks (Rivai, 2007). This caused the growth of Islamic banking third party funds (TPF) to experience a slight setback (Hamzah, 2009).

Foreign exchange rates are the price of a currency expressed in other currencies. The exchange rate is considered important because it can affect the relative price level of an export or import item (Rarick, Falk, Barczyk, & Feldman, 2012). If a country experiences a rate of exchange, it affects the price of goods produced domestically which become expensive and unreachable, while imported goods become cheaper, or vice versa if the exchange rate of a country experiences a decrease, domestically produced goods become cheap and imported goods are much more expensive (Rivai, 2007).

Depreciation of the rupiah against hard currencies such as the United States Dollar (US Dollar) can cause capital outflows or escape from public capital because if compared with other currencies, the expected return on investment in Indonesia is lower (Abdul Rahman, Muhammad, Ahmed, & Amin, 2016). The increasing exchange rate of the US dollar will increase the demand for dollars, whereas the demand for domestic money will decrease (Amin, Rizal Abdul Hamid, Lada, & Baba, 2009). Based on this, changes in the rupiah exchange rate against hard currencies, including the US dollar, can affect the growth of the number of accounts and deposits in Islamic banking (Muttaqiena, 2013).

Exchange rate fluctuations and expectations of large fluctuations in rupiah depreciation can cause public funds to move or run to high-quality banks and foreign banks in the country and abroad (currency substitution) (Hamzah, 2009). The turmoil will also result in bank debtors experiencing business difficulties, with the consequent consequence of being unable to

pay the principal and interest to the bank (Ahmed, 2010). As a result, banks experience liquidity difficulties and cause an increase in the cost of funds so that banks cannot fulfill their obligations to Third Party Funds (TPF) (Sudarsono, 2009).

The money supply is the overall value of money in the hands of the people. The money supply in the narrow money is the amount of money in circulation consisting of currency and demand deposits (Ghazali et al., 2018). Technically, what counts as the money supply is money that is really in the hands of the people (Syukur & Nimsai, 2018). Money in the hands of banks, as well as banknotes and metals belonging to the government are not counted as money supply. The money supply is another term for money supply. Money supply is a relatively new study material compared to money demand (Camillo, Marques, Holt, & Hu, 2014). This condition is caused by the assumption that money supply can be determined directly by the central bank so that it cannot be influenced by other external factors (Ghazali et al., 2018).

In terms of terminology, there is a difference between the definitions of JUB (the amount of money in circulation) from the time of classical economics to the present. Some classical economists interpret money supply as banknotes and coins in the hands of the public (also called currency or currency) (Ahmad, Omar, Munap, & Rose, 2018). In contrast to now the money supply is better known by several meanings, namely Narrow money, currency and demand deposit broad money, narrow money plus quasi money which include the balance of time deposits and savings deposits in banks (Hamzah, 2009). Tohari (2010) in his research concludes that the amount of money in circulation) has a positive and significant influence on TPF, the response shown by Islamic banking TPF on the money supply is the reaction of Islamic banks in seeing the development and growth of the money supply that has increased so that

funds from the money supply can be used for financing (Al-Salim, 2009). The money supply has a positive influence on deposits in Islamic banking in Indonesia, in the sense that if the money supply increases, the TPF will also increase (Lever & Miele, 2012).

### The Research Method

The variables in this article are inflation (X1), BI rate (X2), the rupiah exchange rate against the US dollar (exchange rate) (X3), the money supply (X4), and Third Party Funds or DPF (Y). The population in this article is Islamic banking data published by Bank Indonesia in its monthly report (Rivai, 2007). Where the sample taken uses all the existing population as many as 48 samples (data) which are monthly data on Inflation, Third Party Funds (TPF) of Islamic Banking, BI rate, Exchange Rate of Rupiah against US Dollar, and Amount of Money Supply from 2013 to 2016.

Third Party Funds or Deposits are funds collected by banks that come from the community in a broad sense including the community (Pratiwi & Lukmana, 2015), individuals and business entities (Ismail, 2011). Deposits are collected in the form of *wadiah* giro, *wadiah* savings, *mudharabah* savings and *mudharabah* deposits.

Formula:

$$\Sigma TPF = SW + SM$$

$\Sigma TPF$  : Amount of Third Party Funds

SW : *Wadiah* Deposits (Current Accounts, Savings Accounts)

SM : *Mudharabah* Deposits (Savings, Deposits)

The indicator that is often used to measure the inflation rate is the Consumer Price Index (CPI). The formula used is as follows:

$$\text{Inf} = \frac{(\text{IHK } n) - (\text{IHK } n-1)}{(\text{IHK } n-1)} \times 100\%$$

- Inf : Inflation
- CPI n : CPI of the month in question
- CPI n-1 : CPI the previous month

Exchange rate is a comparison of a country’s currency exchange rate with a foreign currency or a comparison of exchange rates between countries. While the rupiah exchange rate against the US dollar is a comparison of the rupiah exchange rate against the US dollar.

$$\text{Middle exchange rate} = \frac{\text{selling rate} + \text{buying rate}}{2}$$

The money supply in the narrow money is the amount of money in circulation consisting of currency and demand deposits.

$$M1 = C + D$$

- M1 : money supply in a narrow sense
- C : Banknotes
- D : Check money or check

Broad money in the broad sense (M2) is added to time deposits.

$$M2 = M1 + TD$$

- M2 : The amount of money in circulation in a broad sense
- TD : Time deposits

The data analysis technique used in this study is testing the model of multiple linear regression equations. Systematically the regression equation can be made as follows:

$$TPF = \alpha_0 + \beta_1 \text{Inf} + \beta_2 \text{Birate} + \beta_3 \text{Kurs} + \beta_4 \text{JUB} + e$$

TPF : Third Party Funds

Inf : Inflation

Birate : BI rate

Exchange rate : Rupiah exchange rate against dollar

JUB : Amount of Money Circulating

$\beta_1, \beta_2, \beta_3, \beta_4$  : The regression coefficients of each independent variable

$\alpha_0$  : Constants

e : Error

### Analyzing the Relations

Quantitative data on Third Party Funds (TPF), inflation / CPI (Consumer Price Index), BI Rate, Exchange Rate, and Amount of Money Supply (JUB) are obtained through Bank Indonesia monthly reports. Based on the data that has been processed using SPSS 23, descriptive statistics are obtained as follows:

**Table 1. Descriptive Statistics**

	N	Minimum	Maximum	Mean	Std. Deviation
TPF	48	3205006	4836758	4023479,40	474404,576
INF	48	-,0045	,0329	,004692	,0066819
BI_RATE	48	,0475	,0775	,069010	,0090615
KURS	48	9687	14396	12253,19	1327,853
JUB	48	3268789	5004977	4097457,60	495639,979
Valid N (listwise)	48				

Source: data processed, 2016

Based on table 1 above, it is known that N or the total amount of data in this study amounted to 48 pieces. The processed data is known as the lowest and highest value, average and standard deviation of the variables of TPF, inflation / CPI, BI rate, and JUB.

Before we test multiple linear regression analysis, the data is tested using the classic assumption test so that the results in this study are valid and unbiased. Classical assumptions used are normality test, multicollinearity test, autocorrelation test, and heteroscedasticity test.

**Normality Test**

To see whether the data is normally distributed or not, normality is tested using the One-Sample Kolmogorov-Smirnov Test. After the data is processed using the SPSS 23 application, the following results are seen:

**Table 2. One-Sample Kolmogorov-Smirnov Test**

		Unstandardized Residual
N		48
Normal Parameters <sup>a,b</sup>	Mean	,0000000
	Std. Deviation	23616,25185951
Most Extreme Differences	Absolute	,062
	Positive	,062
	Negative	-,055
Test Statistic		,062
Asymp. Sig. (2-tailed)		,200 <sup>c,d</sup>

Source: secondary data, processed (2016)

The test results show that the significance value is  $0.200 > 0.05$ , then the data is normally distributed, so that it can proceed to the next test.

***Multicollinearity Test***

The results of multicollinearity testing are as follows:

**Table 3. Multicollinearity Test Results**

Model		Collinearity Statistics	
		Tolerance	VIF
1	(Constant)		
	INF	,858	1,166
	BI_RATE	,286	3,497
	KURS	,051	19,677
	JUB	,053	18,836

a. Dependent Variable: TPF

Source: secondary data, processed (2018)

The test results show that all variables used as predictors of the regression model show the VIF value of the exchange rate and JUB above 10. This shows the presence of symptoms of multicollinearity. However, in the opinion of Geary R.C as quoted by Gujarati (1993) states that if the only purpose of regression analysis is to predict, then multicollinearity is not a serious problem so the regression model can be further analyzed. But this is only true if multicollinearity between variables in the research sample will also remain in the future.

***Autocorrelation test***

According to Sunyoto (2007: 104-105), one measure to determine whether there is an autocorrelation problem with the Durbin Watson (DW) test with the following conditions:

- 1) A positive autocorrelation occurs if the DW value is below -2 (DW < -2)
- 2) There is no autocorrelation if the DW value is between -2 and +2 (-2 < DW < 2)
- 3) Negative autocorrelation occurs if the DW value is above 2 (DW > 2)

**Table 4. Durbin Watson’s Test Results**

Model	R	R Square	Adjusted R Square	Durbin-Watson
1	,999 <sup>a</sup>	,998	,997	,991

a. Predictors: (Constant), JUB, BI\_RATE, INF, KURS

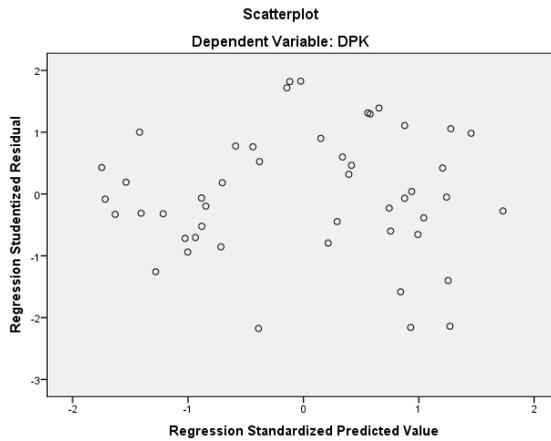

b. Dependent Variable: TPF

The results of autocorrelation testing using the Durbin Watson test (DW test) showed that DW of 0.991 was between -2 and 2 (-2 < DW < 2) so autocorrelation did not occur which meant passing the autocorrelation test.

**Heteroscedasticity test**

Heteroscedasticity testing uses scatterplot graphics. Following are the results of testing heteroscedasticity:

**Figure 3. Scatterplot Graph Test Results**

Source: secondary data, processed (2016)

Heteroscedasticity testing results shows that the regression model does not contain heteroscedasticity. This can be made a decision that there are no specific patterns such as the existing dots form a regular pattern (wavy, then narrow) so there is no heteroscedasticity.

**Determination Coefficient**

The coefficient of determination will later measure how far the ability of the model in explaining dependent variation. The estimated relationship between variables that affect the amount of TPF can be shown as follows:

**Table 5. Multiple Linear Regression Results**

Model	R	R Square	Adjusted R Square
1	,999 <sup>a</sup>	,998	,997

a. Predictors: (Constant), JUB, BI\_RATE, INF, KURS

b. Dependent Variable: TPF

Source: Secondary data, processed (2016)

Based on the table above, the value (Adj R<sup>2</sup>) is 0.997 or 99.7%. This shows that the variation of the independent variables used in the model is able to explain 99.7% of the variation of the dependent variable. While the remaining 0.3% is explained by other variables.

**F Statistical Test (Model Accuracy Test)**

F statistic test basically shows whether all independent or independent variables entered into the model have a joint influence on the dependent or dependent variable (Ghozali, 2006).

**Table 6. Statistical Test Results F**

	Model	F	Sig.
1	Regression	4327,197	,000 <sup>b</sup>
	Residual		
	Total		

a. Dependent Variable: TPF

b. Predictors: (Constant), JUB, BI\_RATE, INF, KURS

Source: Secondary data, processed (2016)

From F test in table 4.12 above, it obtained  $F_{\text{count}} > F_{\text{Table}}$  is  $4327.197 > 2.432236$  with a significance of  $0.000 < 0.05$ . This can mean that inflation, the BI Rate, exchange rate and the money supply together influence the number of Islamic bank deposits. This F test also means that the selection of the inflation variable, BI Rate, exchange rate and the money supply as a predictor of Islamic banking deposits is right.

The regression equation model can be written from the table above as follows:

$$\text{TPF} = -65.168,304 - 1.038.739 \text{ INF} + 2.303.969,572 \text{ BI\_RATE} + 1,931 \text{ KURS} + 0,954 \text{ JUB} + e_t$$

TPF: Third Party Funds

INF: Inflation

BI\_RATE: BI Rate

EXCHANGE: Rupiah Currency Exchange Rate against US Dollar

JUB: Amount of Money in circulation

$\beta_1, \beta_2, \beta_3, \beta_4$ : The regression coefficients of each independent variable

$\alpha_0$ : Constants

er: Error

**Table 7. Hypothesis Analysis Results**

	Regression coefficient	t-count	t Table	Sign	Result	Description
Constants	-65.168,3					
Inflation	-1.038.739,8	-1,785	2,01669	0,081	Reject H1	No effect
Bi Rate	2.303.969,6	3,100	2,01669	0,003	Accept H2	Berpengaruh
Rupiah exchange rate against US dollar (exchange rate)	1,931	0,161	2,01669	0,873	Reject H3	No effect
Total money supply	0,954	30,266	2,01669	0,000	Accept H4	Take effect

Source of data: data processed by SPSS (2016)

### Analyzing the Influences

Hypothesis testing 1 in this article is intended to find out whether there is an influence between inflation on the amount of Third Party Funds (TPF). In the regression table obtained the value for the inflation

variable of 2.01669 with a significance of  $0.081 > 0.05$ , the first hypothesis is rejected, meaning that inflation does not significantly influence TPF in Islamic Commercial Banks in Indonesia. The results showed that inflation had no effect on TPF with a significance value of 0.081 then H1 was rejected at a significance level of 5%. The regression results of the inflation variable have a regression coefficient of -1.038.739.8 with a negative direction, which means that an increase in inflation will reduce the Third Party Fund of Islamic Commercial Banks.

This article findings may be discussed with such research as Shafiq (2016), (Ferdiansyah, 2015), Hermanto (2008) which states that inflation does not affect Islamic Bank Third Party Funds (TPF), and is contrary to the results Salviana (2014) which states that inflation has a significant effect on TPF. Testing of hypothesis 2 in this study is intended to find out whether there is a significant and significant influence of BI Rate on the amount of TPF. In the regression table is obtained the value for the BI Rate of 3.100 with a significance of  $0.003 < 0.05$ , then the hypothesis is accepted, meaning that the BI Rate has a significant effect on the positive direction of TPF in Islamic Commercial Banks.

The results show that the interest rate (BI Rate) affects TPF with a significance value of 0.003, so H2 is received at a significance level of 5%. This shows TPF depends on the BI Rate. The BI Rate has a regression coefficient of 2,303,969.6, meaning that the BI rate has a positive relationship with the number of Islamic Commercial Bank TPF. The increase in interest rates (BI rate) on Islamic Commercial Banks is predicted to increase TPF at Islamic Commercial Banks. The interest rate (BI rate) has a positive effect on the amount of Third Party Funds where the increase in profit sharing rates attracts customers to save funds in Islamic banking. This result does not support the statement of the Islamic Banking Director, Ramzi A Zuhdi said, "Usually in general, if the BI Rate falls,

Third Party Funds (TPF) will rise, running from conventional banking to Islamic Banks” (Prasetyoningrum, 2015). Comparing this article finding to Prasetyoningrum (2015) where the interest rate (BI Rate) has an insignificant effect but has a negative direction to TPF. The results of this article are also different from Hermanto (2008) research which states that the interest rate (BI Rate) has a significant effect but with a negative direction on TPF.

The testing of hypothesis 3 in this article is intended to find out whether there is a significant influence between the rupiah exchange rate and the US dollar (exchange rate) on TPF. In the regression table obtained the value for the exchange rate variable is 0.161 with a significance of  $0.873 > 0.05$ , then hypothesis 3 is rejected. This means that the exchange rate does not have a significant effect on TPF in Islamic Commercial Banks. The results shows that the rupiah exchange rate against the US dollar (exchange rate) had no significant effect on TPF. The regression coefficient of the exchange rate variable is 1.931 with a positive direction. This means that every exchange rate increase is predicted to increase the collection of Third Party Funds of Islamic Commercial Banks. This happens because people prefer to save their money in Islamic banking when the dollar rises rather than spend it. This result is different from the results of research by Pratiwi & Lukmana (2015) and Salviana (2014) which state that the exchange rate has a positive and significant effect on the amount of TPF.

Testing the hypothesis 4 in this study is intended to find out the money supply (JUB) and the amount of TPF. In the regression table obtained by the value for the variable money supply (JUB) of 30.266 with a significance of  $0.000 < 0.05$ , the hypothesis is accepted. The money supply (JUB) has a significant effect on the positive direction of TPF in Islamic Commercial Banks. The results of testing hypothesis can prove that the hypothesis supports a positive and significant relationship between the

money supply (JUB) and TPF. The results of testing hypothesis 4 are in line with the findings of Shafiq (2016). This means that if the value of JUB gets bigger, the TPF in Islamic Banking will be greater. The results of this research can be explained by the amount of money circulating in the community is high, resulting in inflation and a decline in the purchasing power of the rupiah. The decline in the value of the rupiah resulted in people reluctant to do business and chose to keep it in the bank (Tohari, 2010). So there is an increase in banking deposits, including in this study is Islamic banking.

F statistic test basically shows whether all independent or independent variables entered into the model have a joint influence on the dependent or dependent variable (Ghozali, 2006). The results of the statistical test F are as follows:

**Table 8. The results of the F test hypothesis analysis**

	F hitung	Sign	Ket	Hasil
Variabel secara simultan	4327,2	0,000	Terima H5	Berpengaruh Signifikan

Source: data processed by SPSS (2018)

From the F test in table 4.12. above obtained  $F_{count} > F_{Tabel}$  is  $4327.197 > 2.432236$  with a significance of  $0.000 < 0.05$ . This can mean that inflation, the BI Rate, exchange rate and the money supply together influence the number of Islamic bank deposits. This F test also means that the selection of the inflation variable, BI Rate, exchange rate and the money supply as a predictor of Islamic banking deposits.

## **Conclusion**

Based on the results of data analysis, hypothesis testing, and discussion, the following conclusions can be drawn. The inflation variable does not affect TPF in Islamic Commercial Banks in Indonesia. The BI Rate variable has a significant effect on the positive direction of the amount of TPF in Islamic Commercial Banks. This shows TPF depends on the BI Rate. The increase in interest rates (BI rate) on Islamic Commercial Banks is predicted to increase the amount of TPF in Islamic Commercial Banks. Interest rates (BI rate) have a positive effect on the amount of *mudharabah* savings where an increase in profit sharing rates attracts customers to save funds. The exchange rate variable does not have a significant effect on TPF in Islamic Commercial Banks. The results of this research can be explained that the amount of money circulating in the community is high, resulting in a decrease in the purchasing power of the rupiah. The decline in the value of the rupiah resulted in people reluctant to do business and chose to keep it in the bank. To conclude, there is an increase in banking deposits, including in this study is Islamic banking. Inflation variables, the BI rate, the exchange rate of the rupiah against the US dollar (exchange rate), and the money supply together influence the TPF. Consequently, the selection of the inflation variable, BI rate, rupiah exchange rate against US dollar (exchange rate), and the money supply as a predictor of TPF in Islamic Commercial Banks in 2003-2016 was correct.

In subsequent studies it is expected to use other objects. It is expected that in the research, the research variables will be added, such as national income. It is expected that Islamic banking will consider the BI interest rate (BI rate) and the money supply and in line with this research the BI interest rate (BI rate) and the money supply have a significant effect on the positive direction of third party Islamic Banks, if there is a decrease in the money supply, it will result in a reduction in the amount of Third

Party Funds. It is expected that policy makers, to evaluate and strengthen macroeconomic developments (especially BI interest rates (BI rate) and the money supply) so that Islamic banking is resistant to the shock of the monetary crisis that occurred in Indonesia.

## Shirkah Author Guidelines

**Shirkah** currently offers two routes to submit manuscripts. We highly recommend to submit the articles which are made using OJS (Open Journal System). Feel free register as author soon through visiting <http://shirkah.or.id/index.php/home/user/register>. The authors may directly send their manuscripts, along with their resume, to [shirkahiainsurakarta@gmail.com](mailto:shirkahiainsurakarta@gmail.com). Please prepare your manuscripts, using following guidelines:

1. Manuscript must be written in English. Submitted articles should not have been published or be under review for publication with another journal.
2. Manuscript's length is about 15 – 20 pages, typed in one-half spaced on A4-paper size.
3. Manuscript must include an 150 – 200 word abstract and keywords.
4. Manuscript must be arranged as follows: Title, Name of Author, E-mail address, Abstract, Keywords, Introduction (including method if any), Discussion, Conclusion, References.
5. Manuscript's titles not more than ten words.
6. Manuscript must be submitted in Microsoft Word or RTE.
7. Arabic words should be transliterated according to the style of *International Journal of Middle Eastern Studies*.
8. Manuscript references are preferably derived from the up-to-date references.
9. The author's resume should be submitted separately, consisting of at least full name, institutional address, phone number, areas of studies, and recent publications (if any).
10. **Shirkah** use APA Style 6th edition (2010) as reference format writing. We suggest the use of a reference manager software such as Mendeley, Zotero, and Endnote at templating the citation style. APA Style to be used is as follows:
